hi!!!..i need you help ,you vintage kustoms experts..

i decide to suscribe my self at this forum by 2 reasons.

learn more about kustom gear and try to get the 1145 pa diagram.

i want to fix it..but i dont have any information...theres almost nothing out there,,and this forum could be the holy anwer..

i really need you help guys....if you have it..say it please.

well-breadings...peace and long life!!!!!!

thanks for ur time!

byke!!!!

Hello and welcome.

Can you post a shot or two of the inside of the head as I think I have both choises of schematics that you may need.

Welcome, and I'm sure someone can help you. Your model number indicates that it is a K200A-5 PA head. The 1145 model is the head with the the 2 3x15 siren cabinets. It is pictured in the 67/68 catalog in the literature section of this site.

If the unit is a K200B-5, I have a pdf file of the schematic. It's made to print out to 11" x 17" paper. Send me your email and I'll send you the file.

The model number 1145 is the A series K200. Same as the 745 and the 795 models of the same era. The K200B series started the standard models of K200B-1, K200B-2, K200B-3, K200B-4 and K200B-5 which made it a lot easier for kustom to simplify the heads and labeling schematics. I know there are changes to the circuits between the A and the B series but not being a tech, I don't know what they would be. If you can tell us what the amp is doing or not doing, it might be easier for a tech to help pinpoint where to start looking. Does the amp even turn on? Works but hum or low power? Reverb not working?

I'm not a tech either, so don't quote me on any of this. But I believe I remember reading that there is a definite difference between the circuitry of the A-series compared to the B-series.

I sent the original poster a copy of the PDF file I created that has all the K200B-5 circuitry. I hope he's reading this if his unit is an A-series, since apparently, the schematics I sent him are not for his amp.

If anyone else needs a copy of the K200B-5 schematic, let me know.

Rod

hi guys-here is a pic of my amp-...well the transistors are right..
just one doesnt works..i changed it ..now im taking of the old conections for new in the same

way..when i turn it on the light have a litle energy..does not any sound....im doing a test to know what happens..i dont know where is the correct model ..if is a or b--in the pc amp(the circuit of the amp power) says 702---its the only information i have ..

<http://www.anumex.com/pictures/967071-3.jpg>

i think that with the right schematic i could fix it.

going on...

well,,breadings..and thanks a lot for everything..
pd.if somebody have the k200-a model schematic please let me know.

peace and long life!!!!!!!!!!

Please post a picture of the inside of the amp, not the outside!
