All ... replying to thetragichero at this time going to try to talk him through a step by step to resolve this.

Update May 9 - had phone phone call with thetragichero and determined the accidental short wiped three of the four outputs.

He is going through the board rechecking diodes / transistors and resistors then ordering what he needs. This beast will roar again.

I highly recommended as others have that he implement a light bulb limiter into the process.

John
