---

I just bought a Kustom 150-2 and know very little about this set up.. My problem is when I play through it and I set the volume up to about 5 the low B string on my bass rattles the speakers really bad... As the band plays in Drop D a lot, is there a solution like setting up the tone controls or something or is this just the nature of the 2-12's which have been replace in the last year with minimal play time on them...I have always used a 15 or 18...I have been trying to "dial" it in but no luck as of yet and I want to use it on the gig tomorrow... Any advice??? Thanks
