Merry Christmas and Happy Holidays from a new member, Ray.

My son got a real flea market find for Christmas and hopefully there is some info available. It is an old Kasino amp. The only marking on it is a badge that simply reads 200 on the front grill cloth. There is a built in solid state power amp that is inserted through the back amp panel and screwed in. On the back is a metal plate that only gives electronics info.
Output = 100watts Primary = 120V FREQ=60Hz. INPUT=1.8Amps
I don't have a power chord for it nor would I have plugged it in if I did.

When I took the full back panel off and disconnected the speaker leads from the amp to the speaker jumper strip there was a white Kustom Amp stamp in the junction between all four speakers.

The speakers don't have a brand name on them but have the following info stamped on them:

5 8122 18

8 OHM

137 7138

038-0011-00

I guess the 1st question I have is does anyone know what exactly do I have? I could not find a single piece of info on this particular piece anywhere.

2nd question is can the cabinet as is it is without the solid state power amp powered up be used passively?

Any historic or functional info on this amp/cab would be GREATLY appreciated.

Merry Christmas and Happy Holidays,
Ray
