Both the on/off and polarity switches are stuck. The amp will not turn on. I am told there is an internal fix for this. Both switches look perfect. The blue plastic is not broken or damaged. I apologize for asking about this twice. The first time was within another members post and I am unsure if the answer was to their or my question so I decided to start a new post. I am trying to attach an image of the front panel. Not sure how to do that.

The square blue plastic is the extension used to actuate the switch section.

If you pm me your email address I will send you photos to help you.

Please note that #1) photos can not be posted to this site, #2 I have to approve 5 of your post before they automatically go up to the board.
