---

I recently acquired a Kustom Kasino combo amplifier. There are no name-plates or markings or serial numbers on it anywhere. It is a 4x12 combo. The head has a high and low input, there are 4 input to module outlets in the back and 2 120v plug outlets also in the back. The fuse is obviously blown and there also is a couple of resistors that are smoked. was getting some weird readings on the component tester also. I just desperately need some schematics for this amp, does anybody have an idea what this might be? The board with the transistor plugs has the markings KEI-1 PC5024. Ive seen almost every other PC number on the internet with schematics accept for this one. Can somebody please point me in the right direction.

Try and post some photos if you can.

Look in the literature section and see if it's there.
